

Panel Fillets & Mock Joints

Shape a clean finish.

Extruded PVC profiles for chamfered edges and decorative joints in precast concrete panels.

*FILLET15T also supplied in grey

The finished detail

A clean, straight chamfer defines the edge of the concrete panel.

Defined edges

Panel and tail profiles create neat chamfers along the panel edge.

Decorative details

False joint profiles create a recessed detail across the panel face.

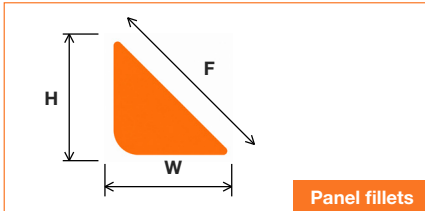

Easy preparation

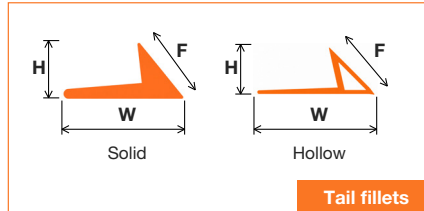

Lightweight profiles can be cut with hand tools at the casting bed.

Select your profile

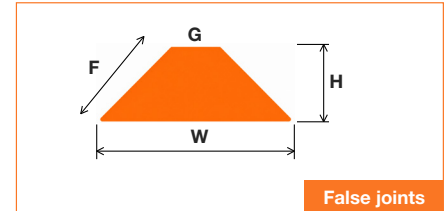

Panel fillets form chamfered edges, and are usually sealed to the casting bed and formwork. Tail fillets add a fixing flange for nailing onto the top of formwork elements. False joints create decorative grooves in the panel face to create the impression of separate panels.
